

## **Are You Drinking Acid?**

**By Jan Stevens, MA, and Elisabeth Penland, BS, Research Technician**

What is the pH of the water you are drinking? The quality of your water does matter. On June 26, 2005, a random sampling of the following bottled waters was performed. In this screening, only the pH of the water was tested. These are the results at this time.

Although these were the lots that were tested, there is variability according to the water's source, and the source can change over time. Not only can the pH vary from lot to lot, but it can also vary, depending on where the water was bottled.

The pH Meter was calibrated before use. A sample pH 7 buffer and a pH 10 buffer were used with the sample.
